4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **salestaxreversecalculator.com** for a **Financial Web Application / Interactive Calculator Tool** site, generated on November 09, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

87/100

SEO HEALTH SCORE

Critical Issues Found:

1. 9 Canadian provincial calculators are orphaned (in sitemap.xml with 0 incoming internal links)
2. 55 page titles exceed 60 characters and 50 meta descriptions exceed 160 characters, causing mobile SERP snippet truncation
3. Severe CTR depression on high-volume state pages (e.g., /us/new-york at Pos 9.1 with 2,133 impressions has only 0.05% CTR)
4. GSC tracking URL fragment links (/#calculator, /#faq) due to on-page hash anchor navigation
5. Missing Content-Security-Policy (CSP) header despite strong HSTS and X-Frame-Options

Quick Wins:

1. Link all 9 Canadian provincial pages from /canada province grid to resolve orphan page status immediately
2. Rewrite /us/new-york title and meta description to target high-intent NYC 8.875% tax extraction, lifting CTR from 0.05%
3. Trim state calculator titles to 52-58 chars (e.g. 'Arkansas Reverse Sales Tax Calculator (9.49%)') to prevent truncation
4. Add Content-Security-Policy header in next.config.mjs or vercel.json
5. Add BreadcrumbList schema to the 3 utility hub pages currently missing it

2. Audit Categories

2.1 Technical SEO

Score: 84/100

What Works

- 100% canonical accuracy with zero mismatches or cross-domain issues across all 79 URLs
- Clean robots.txt allowing search and AI crawlers with explicit sitemap reference
- Solid edge performance on Vercel with 447ms average server TTFB
- Real HTTP 404 response on non-existent endpoints (no soft-404 catch-alls)
- Full HTTPS enforcement with Strict-Transport-Security (max-age=63072000; preload)

Findings

9 Canadian provincial pages orphaned with 0 internal links Critical

Pages for Manitoba, Saskatchewan, Nova Scotia, New Brunswick, Newfoundland, PEI, NWT, Nunavut, and Yukon exist in sitemap.xml but have zero internal inlinks.

Recommendation: Update /canada to include a full grid of all 13 provinces/territories with descriptive anchor text.

Fragment URLs accumulating impressions in Google Search Console Medium

URLs with hash fragments (/#calculator, /#faq, /#how-it-works) appear in GSC with over 140 combined impressions.

Recommendation: Audit internal navigation links and canonical references to ensure all links use clean path-based URLs without bare hash anchors.

Missing Content-Security-Policy (CSP) Header Low

Vercel edge responses include HSTS, X-Content-Type-Options, and X-Frame-Options, but no Content-Security-Policy is set.

Recommendation: Configure a Content-Security-Policy header in next.config.mjs to protect users against XSS and injection.

2.2 Content Quality & E-E-A-T

Score: 86/100

What Works

- Comprehensive explanation of mathematical reverse sales tax formulas (Formula: Pre-Tax = Total / (1 + Rate))
- Fully server-rendered content (8,413 words on homepage) accessible without client-side JS execution
- High depth on state pages with local county/city tax nuance tables and exemptions
- Clear authoritativeness signals including dedicated Person and Organization review team schemas

Findings

Boilerplate pattern across state pages risks repetitive content filtering Medium

50 state pages follow identical structural sections. While specific tax rates differ, intro and FAQ paragraphs share template phrasing.

Recommendation: Enrich top 15 highest-impression states (NY, CT, TX, UT, CA, NC, FL) with state-specific filing deadlines, nexus thresholds, and local tax nuance tables.

High impression query mismatches on specific tax math queries Medium

Users search for concrete math examples like 'christa went shopping for back-to-school clothes... if sales tax is 6% what was total' (27 imp, pos 9.4).

Recommendation: Add a 'Worked Examples & Word Problems' section to the FAQ addressing common receipt totals ($10, $50, $100, $176) at standard rates.

2.3 On-Page SEO

Score: 84/100

What Works

- 100% single H1 tag coverage across all 79 site pages
- Zero duplicate titles or duplicate meta descriptions detected across the entire site
- Logical H2 and H3 heading hierarchies mirroring searcher intent
- Consistent Open Graph and Twitter Card social metadata implementation

Findings

55 Page titles exceed 60 characters (SERP pixel truncation) High

Titles on state pages average 68-70 characters (e.g. 'Arkansas Sales Tax Calculator 2026: Calculate or Back Out Tax (9.49%)'), causing tax rates to truncate in mobile SERPs.

Recommendation: Refactor state title template to: '[State] Reverse Sales Tax Calculator ([Rate]%)' (under 55 characters).

50 Meta descriptions exceed 160 characters Medium

Descriptions reach 172-201 characters, resulting in truncated snippets that hide the call to action.

Recommendation: Tighten meta descriptions to 145-155 characters, leading with the core utility and instant pre-tax extraction.

Low CTR on #1 Impression State Page: /us/new-york (0.05% CTR) High

/us/new-york ranks at average position 9.1 with 2,133 impressions but only 1 click, indicating snippet mismatch for NYC and county searchers.

Recommendation: Update New York meta title to: 'New York Reverse Sales Tax Calculator: 8.875% NYC Included' to match high-volume local search intent.

2.4 Schema & Structured Data

Score: 94/100

What Works

- Rich @graph implementation on state pages containing WebApplication, HowTo, FAQPage, and BreadcrumbList
- Organization and WebSite schemas properly linked with logo and publisher identity
- Interactive tool correctly classified as FinanceApplication / WebApplication
- HowTo schema includes structured step-by-step instructions for reversing sales tax calculations

Findings

3 Utility hub pages missing BreadcrumbList schema Low

While 76 pages have complete BreadcrumbList markup, 3 utility pages (/tax-rates, /about, /contact) lack breadcrumb structured data.

Recommendation: Inject consistent BreadcrumbList JSON-LD across all pages for uniform SERP breadcrumb display.

2.5 Performance & Core Web Vitals

Score: 83/100

What Works

- Average TTFB of 447ms served globally via Vercel Edge Network
- Preloaded web fonts (woff2) avoiding layout shifts and FOIT
- Responsive image optimization via Next.js next/image with srcset and sizes
- Clean responsive viewport with no horizontal scrolling or touch-target failures

Findings

Multiple small JavaScript chunk requests during Next.js hydration Low

Page loads 8+ script chunks for interactive state. Although TTFB is fast, bundling small chunks reduces HTTP overhead.

Recommendation: Ensure Turbopack script optimization combines smaller runtime chunks for faster mobile parsing.

2.6 AI Search Readiness (GEO & Agentic)

Score: 96/100

What Works

- Exceptional llms.txt (3,012 bytes) and llms-full.txt conforming to community standards
- Robots.txt explicitly grants permission to GPTBot, ClaudeBot, PerplexityBot, CCBot, Google-Extended, and OAI-SearchBot
- 8,413 words of clean server-rendered content accessible to LLM web scraping agents without JavaScript
- Mathematical formulas structured into clean markdown-friendly definition blocks

Findings

Missing Content-Signal header for AI training preference declaration Info

Optional Cloudflare / IETF Content-Signal header is not declared on robots.txt.

Recommendation: Optionally add 'Content-Signal: search=yes, ai-input=yes, ai-train=no' to establish content usage preferences.

Missing WebMCP declarative tool registration Info

The site provides financial calculation utilities but lacks WebMCP registerTool() wrappers for autonomous agent invocation.

Recommendation: Implement WebMCP tool registration on the calculator form for agentic browser interactions.

2.7 Images

Score: 95/100

What Works

- 100% of images possess descriptive, non-empty alt text attributes
- Next.js optimized WebP/AVIF generation with responsive srcset attributes
- Preloaded formula diagram image above the fold preventing LCP delay

Findings

Hero diagram image rendered at 3840px max width candidate Low

The formula diagram image srcset includes up to 3840w which is oversized for mobile screens.

Recommendation: Cap max srcset generation width to 1600px to save CDN bandwidth.

3. Action Plan

Phase 1: Critical Fixes & Orphan Elimination Week 1

- Fix Canadian Province Orphans: Add all 9 missing provinces (MB, SK, NS, NB, NL, PE, NT, NU, YT) to the /canada hub navigation grid
- Optimize High-Volume State SERP Snippets: Rewrite /us/new-york title and meta description to explicitly highlight 8.875% NYC tax extraction
- Trim State Page Titles: Shorten all 55 state titles from ~69 chars to 52-58 chars to eliminate mobile SERP truncation

Phase 2: High-Impact CTR & Content Improvements Weeks 2-3

- Target Striking Distance Keywords: Create dedicated on-page sections for 'how to calculate sales tax backwards from total' (Pos 9.7) and 'reverse tax calculator' (Pos 9.2)
- Address Math Word Problem Queries: Add worked examples for common dollar figures ($10, $50, $100, $176) to capture featured snippets and AI Overviews
- Compress Meta Descriptions: Shorten 50 state page descriptions to 145-155 characters with clear pre-tax calculation call-to-actions

Phase 3: Schema & Technical Hardening Month 2

- Deploy Content-Security-Policy (CSP) headers in Vercel configuration
- Audit Internal Hash Links: Replace bare #calculator and #faq internal links with canonical path structures
- Standardize BreadcrumbList structured data across the remaining 3 utility pages

Phase 4: Agentic SEO & Continuous Monitoring Ongoing

- Implement WebMCP registerTool() on calculator forms for AI agent accessibility
- Track GSC striking distance keyword movements weekly
- Monitor Google Search Console Generative AI control and AI citation metrics

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)

Report generated by Claude SEO — Google SEO Intelligence Skill — November 09, 2026
Methodology based on Google Web Vitals thresholds, Search Console documentation, and Lighthouse scoring algorithms.
